DETAILED ACTION

This application has been reviewed. The new claims 4-19 are pending. The rejections are as stated below.

Claim Objections

- 1. Claims 9, 15 and 19 are objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim.

 Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form.
 - a. Claim 9 refers to claim 8 with a further limitation on lines 1-2, "wherein the expert rules are implemented in the form of fuzzy logic rules". This limitation is the same limitation of claim 8.
 - b. Claim 15 refers to claim 14 with a further limitation on lines 1-2, "wherein the expert rules are implemented in the form of fuzzy logic rules". This limitation is the same limitation of claim 14.
 - c. Claim 19 refers to claim 18 with a further limitation on lines 1-2, "wherein the expert rules are implemented in the form of fuzzy logic rules". This limitation is the same limitation of claim 18.

Claim Rejections - 35 USC § 112

- 2. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Application/Control Number: 10/070,490 Page 3

Art Unit: 3691

3. Claims 4 and 10 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

- 4. Claim 4 recites the limitation "the current transaction data" in line 4. There is insufficient antecedent basis for this limitation in the claim. This limitation is preceded by "a current transaction". It is unclear if the applicant refers to "the current transaction data" as meaning the same as "a current transaction". The Examiner will conclude that is referring to "the current transaction data" as meaning the same as "a current transaction".
- 5. Claim 10 recites the limitation "the current transaction data" in line 4. There is insufficient antecedent basis for this limitation in the claim. This limitation is preceded by "a current transaction". It is unclear if the applicant refers to "the current transaction data" as meaning the same as "a current transaction". The Examiner will conclude that is referring to "the current transaction data" as meaning the same as "a current transaction".

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

Application/Control Number: 10/070,490 Page 4

Art Unit: 3691

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

- 7. Claims 4-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over O'Mara et al. (US 2002/0120559 A1) in view of Basch et al. (US 6,658,393 B1).
- 8. Claims 4 and 10 discuss a system and method for determining an extent of a risk of a current transaction being fraudulent in the computer controlled transaction system, comprising the steps of: receiving data on the current transaction data in a prediction model; identifying a means of payment used in preceding transactions in the prediction model; combining a limit with a value in the prediction model for generating an output value that depicts the extent of the risk of the current transaction being fraudulent; and initiating reactions to the current transaction; wherein the reactions have different magnitudes corresponding to the output value that depicts the extent of the risk of the current transaction being fraudulent; wherein the limit is essentially based on expert rules and the limit being specific for a type of transaction; wherein the value is essentially based on a time series analysis of the preceding transactions with regard to the means of payment and the value being specific for the current transaction; and wherein combining the limit and the value is performed in a floating manner so that the output value varies in accordance with an extent of the risk of the current transaction being fraudulent. O'Mara et al. discloses:
 - a method for determining an extent of a risk of a current transaction in the
 Abstract

 the transaction being fraudulent in the Background of the Invention, 1. Field of the Invention

- a computer controlled transaction system in figure 1 and paragraphs 7, 33 and
 37.
- receiving data on the current transaction data (or in real-time in paragraph 11) in a prediction model, or data elements for a rules based logic, in paragraphs 22-24, 27, and 44-46.
- identifying a means of payment used in preceding transactions in the prediction model in paragraphs 8 and 42.
- combining a limit (in paragraph 51) with a value in the prediction model for generating an output value that depicts the extent of the risk of the current transaction being fraudulent and initiating reactions to the current transaction as receiving a value from the merchant that exceeds expected values in the Abstract, paragraphs 18, 19, 69, determining a rule score and/or a risk score in paragraph 28, and performing risk calculations in figures 1 & 2, paragraphs 17-19, 41 and 58.
- reactions have different magnitudes corresponding to the output value that
 depicts the extent of the risk of the current transaction being fraudulent and the
 limit is essentially based on expert rules and the limit being specific for a type of
 transaction in paragraph 69.
- the value being specific for the current transaction, or real-time transactions in paragraph 11.

and combining the limit and the value is performed in a floating manner so that
the output value varies in accordance with an extent of the risk of the current
transaction being fraudulent in paragraph 71.

Page 6

O'Mara et al. does not specifically disclose the value essentially based on a time series analysis of the preceding transactions with regard to the means of payment and the value being specific for the current transaction. Basch et al. teaches:

- risk value based on a time series analysis in a relational database (910) using a prediction model of the preceding transactions in column 20 (lines 4-39).
- with regard to the means of payment or how the account holder pays on the account in paragraphs Background of the Invention, Summary of the Invention, column 16 (lines 42-57) and column 18 (lines 30-49).
- and the value being specific for the current transaction in the Abstract and column 8 (lines 13-39).

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify O'Mara to include time series calculations for a more detailed and accurate prediction of risk level.

9. Claims 5 and 11 discuss the system and method of claims 4 and 10, wherein the expert rules concern parameters which occur in statistically significant cumulative manner during fraudulent transactions. Claims 4 and 10 have been rejected based on the discussion(s) above. O'Mara discloses this in paragraphs 44-46.

Art Unit: 3691

10. Claims 6 and 12 discuss the system and method of claims 5 and 11, wherein the parameters relate to at least one element selected from the group consisting of an origin of a payment, an origin of a user, a branch of the current transaction, a beneficiary of the current transaction, a magnitude of the current transaction and a value of the current transaction. Claims 5 and 11 have been rejected based on the discussion(s) above.

O'Mara discloses the use of a '30 Day Even Dollar Amount' as a data element in paragraph 44.

Page 7

11. Claims 7 and 13 discuss the system and method of claims 4 and 10, wherein the time series analysis is implemented in the form of fuzzy logic rules. Fuzzy logic rules are described as, defining a limit for each transaction type that corresponds to the (user-specific) "risk readiness", in paragraph 22 of the specification by the applicant. Claims 4 and 10 have been rejected based on the discussion(s) above. While O'Mara does disclose the use of limits for predicting risk in paragraphs 10 and 51, O'Mara does not specifically disclose the use of time-series analysis. Basch et al. teaches the use of time series analysis in a relational database (910) using a prediction model of the preceding transactions in column 20 (lines 4-39). Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify O'Mara to include time series calculations for a more detailed and accurate prediction of risk level.

Art Unit: 3691

12. Claims 8, 9, 14 and 15 discuss the system and method of claims 4 and 10, wherein the expert rules are implemented in the form of fuzzy logic rules. Claims 4 and 10 have been rejected based on the discussion(s) above. O'Mara discloses: the use of expert rules, or data elements for a rules based logic, in paragraphs 22-24, 27, and 44-46; and fuzzy logic in paragraphs 10 and 51.

Page 8

13. Claim 16 discloses a method which is implemented on a computer and which is provided for identifying and determining fraudulent transaction data in a computercontrolled transaction processing system with a prediction model for receiving current transaction data, for processing the current transaction data, and for outputting at least one output value that depicts a probability of a fraudulent transaction, wherein, on the basis of stored data, for a time series analysis, and expert rules concerning parameters which occur in a statistically significant cumulative manner during fraudulent transactions, especially with respect to the origin of the means of payment or user, to the branch and to the beneficiary of the transaction, as well as to the magnitude or value of the transaction, the evaluation is carried out by means of the prediction model with respect to the risk of the current transaction being fraudulent, and a corresponding output value is generated, wherein the prediction model combines a limit, which is essentially based on the expert rules and which is specific for the type of transaction, with a value, which is essentially based on the time series analysis of preceding transactions with regard to the same means of payment and which is specific for the current transaction, in order to generate the output value, and wherein the combination

Art Unit: 3691.

is carried out in a floating manner so that output values can be generated which vary according to the extent of the suspicion of misuse and which can be used to initiate reactions of different magnitude to the current transaction request instead of the definition of only one risk-threshold for authorization of the transaction. O'Mara discloses:

- a method which is implemented on a computer and which is provided for identifying and determining fraudulent transaction data in a computer-controlled transaction processing system Abstract, Background of the Invention '1. Field of the Invention', figure 1, paragraphs 7, 33 and 37.
- a prediction model for receiving current transaction data for processing the current transaction data or data elements for a rules based logic, in paragraphs 22-24, 27, and 44-46.
- and for outputting at least one output value that depicts a probability of a fraudulent transaction as performing risk calculations in figures 1 & 2, paragraphs 17-19, 41 and 58.
- wherein, on the basis of stored data as determining a rule score and/or a risk score in paragraph 28.
- and expert rules concerning parameters which occur in a statistically significant cumulative manner during fraudulent transactions in paragraphs 44-46.
- especially with respect to the origin of the means of payment or user, or types of payments in paragraphs 8 and 42.

Art Unit: 3691

 to the branch, or contractual partner who requested the authorization, as the cardholder to authorizes the transaction in paragraph 12.

 the beneficiary of the transaction, as the merchant in the Abstract, Background of the Invention, Summary of the Invention and paragraph 37.

Page 10

- as well as to the magnitude or value of the transaction and the prediction model combines a limit based on the expert rules in a floating manner in paragraphs 44 and 71.
- The limit specific for the type of transaction, with a value, which is essentially based on preceding transactions with regard to the same means of payment and which is specific for the current transaction, in order to generate the output value and which can be used to initiate reactions of different magnitude to the current transaction request instead of the definition of only one risk-threshold for authorization of the transaction as receiving a value from the merchant that exceeds expected values in the Abstract, paragraphs 18, 19, 69.

O'Mara et al. does not specifically disclose the value essentially based on a time series analysis of the preceding transactions with regard to the means of payment and the value being specific for the current transaction. Basch et al. teaches:

- risk value based on a time series analysis in a relational database (910) using a prediction model of the preceding transactions in column 20 (lines 4-39).
- with regard to the means of payment or how the account holder pays on the account in paragraphs Background of the Invention, Summary of the Invention, column 16 (lines 42-57) and column 18 (lines 30-49).

 and the value being specific for the current transaction in the Abstract and column 8 (lines 13-39).

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify O'Mara to include time series calculations for a more detailed and accurate prediction of risk level.

- 14. Claim 17 discloses the method of claim 16, wherein the time series analysis is implemented in the form of fuzzy logic rules. Claim 16 has been rejected based on the discussion(s) above. While O'Mara does disclose the use of limits for predicting risk in paragraphs 10 and 51, O'Mara does not specifically disclose the use of time-series analysis. Basch et al. teaches the use of time series analysis in a relational database (910) using a prediction model of the preceding transactions in column 20 (lines 4-39). Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify O'Mara to include time series calculations for a more detailed and accurate prediction of risk level.
- 15. Claims 18 and 19 disclose the method of claim 16, wherein the expert rules are implemented in the form of fuzzy logic rules. Claim 16 has been rejected based on the discussion(s) above. O'Mara discloses: the use of expert rules, or data elements for a rules based logic, in paragraphs 22-24, 27, and 44-46; and fuzzy logic in paragraphs 10 and 51.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Muriel Tinkler whose telephone number is (571)272-7976. The examiner can normally be reached on Monday through Friday from 7:30 AM until 4 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alexander Kalinowski can be reached on (571)272-6771. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
